The following claims are presented for examination:

1. (Original) A method comprising:

determining an acoustic center of a transducer, wherein said transducer has a plurality of transducing elements; and

determining an offset of the determined acoustic center from a theoretical acoustic center.

2. (Original) The method of claim 1 wherein determining an acoustic center comprises ensonifying each of said transducing elements, one transducing element at a time.

3. (Original) The method of claim 1 wherein determining an acoustic center comprises ensonifying each of said transducing elements, wherein at least two of said transducing elements are ensonified simultaneously.

4. (Original) The method of claim 1 wherein determining an acoustic center comprises:

disposing a projector near a transducing element; and

ensonifying said element using said projector.

5. (Original) The method of claim 4 wherein determining an acoustic center comprises driving said projector by a signal generator.

6. (Original) The method of claim 1 wherein determining an acoustic center comprises obtaining an electrical response from each of said transducing elements.

7. (Original) The method of claim 6 wherein determining an acoustic center comprises electronically processing said electrical response using an algorithm.

8. (Original) The method of claim 6 wherein determining an acoustic center comprises generating a pictorial representation of said electrical response from each said transducing element.

9. (Original) The method of claim 1 further comprising designating said transducer as being one of either acceptable or not acceptable as a function of said offset.

10. (Previously Presented) A method comprising determining an acoustic center of each of a plurality of transducers, wherein each transducer has a plurality of transducing elements, and wherein the acoustic center of each of said transducers is determined by:

(a) measuring a response characteristic of each transducing element in said transducer; and

(b) calculating a weighted average of said response characteristic of each transducing element as a function of a location of said transducing element relative to other of said tranducing elements in the transducer.

11. (Canceled)

12. (Original) The method of claim 10 comprising determining an offset, for each transducer, from a theoretical or desired acoustical center.

13. (Original) The method of claim 12 comprising basing formal acceptance testing of each said transducer based on said offset for each of said transducers.

14. (Original) The method of claim 12 comprising predicting performance of an array of said transducers based on said offset of each of said transducers.

15. (Original) The method of claim 12 comprising selectively positioning said transducers in an array based on said offset of each of said transducers.

16. (Original) The method of claim 12 comprising basing signal processing calculations for an array of transducers on said offset of each of said transducers.

17. (Original) A method comprising:

calculating an acoustic center of each of a plurality of multi-element transducers;

calculating an offset for each of said plurality of multi-element transducers, wherein said offset is based on said calculated acoustic center and a theoretical acoustic center of each of said multi-element transducers; and

correcting signal processing calculations using said offsets.

18. – **28.** (Canceled)
